Asset overview

The BlackRock USD Institutional Digital Liquidity Fund (BUIDL), issued by BlackRock and tokenized through the Securitize platform, represents a tokenized institutional liquidity fund designed to provide on-chain exposure to U.S. Tokenized shares of the fund are issued as blockchain-based tokens using the ERC-20 standard on the Ethereum network, enabling programmable ownership, digital settlement, and integration with institutional digital asset infrastructure. Each token represents an ownership interest in the underlying fund and provides investors with proportional rights to the economic performance and yield generated by the portfolio.

About this snapshot

Sources: DORRS registry and blockchain analytics; CoinGecko reference pricing. Collected 2026-11-21 03:57 UTC. Source timestamps may differ. Missing values remain unavailable.

Transfer value measures on-chain movement, not exchange trading volume. Holder addresses are not unique investors. TVL, deployment value and token market cap are separate measures. Reported changes use the source's comparison period; a reported 0% does not establish that a prior-period observation exists. Cross-network values may include bridged representations.
